Comment: i would like a variance from these rules in areas where we collect: ranches and other rural locations . we collect native pinion/junipers in rural san migel, santa fe, mora, colfax and other places far from cities or smaill towns. i believe positive trapping should not be necessary in these locations. we have dug trees in these and other locations for years. Never, that am aware of, have there been any instances of japanese beetle presence. These areas are semi desert, hot, dry environments. thanks, dan cassidy, cassidy farms, cleveland, nm
